No errors or problems were found.

Duplicate meta descriptions

Meta descriptions that are used on several pages

No errors or problems were found.

Problems with headings

Pages with problematic headings or problems within the heading structure

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from [H1 to H6](#), which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

Problems with H1 headings

Problematic H1 headings

No errors or problems were found.

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

No errors or problems were found.

Pages with frames

Pages with embedded framesets and IFrames

No errors or problems were found.

Pages that contain error reporting

Software error messages that are shown on the web page that should be avoided

No errors or problems were found.

Images with missing alt attributes

Pages with at least one missing alt attribute for an image

No errors or problems were found.

Pages with big file size

HTML pages exceeding a file size of 0.5 MB

No errors or problems were found.

URL parameters

Relevant pages with dynamic parameters in their URL.

No errors or problems were found.

Session ID in URL

Pages with session IDs in their URL.

No errors or problems were found.

Too many subdirectories

Pages with too many subdirectories in their URL.

No errors or problems were found.

URL too long

Pages with too long URLs

No errors or problems were found.

Non-retrievable file sources

Used files that were not retrieved in detail due to redirections and problems

Optimization Tips

Video tutorial included ►

This analysis gives you an overview of embedded files on your website (e.g. images, CSS and JavaScript files) that could not be retrieved from the server.

Why you should avoid unretrievable embedded files:

If embedded files can not be retrieved, this can have a serious impact on the [user experience](#) of your website. Nobody likes to browse a site where images won't load or the layout doesn't display correctly due to missing CSS files.

It is also important for Google to be able to access all of the relevant files so that the content of your pages can be fully and correctly [indexed](#).

What the messages in the "Error" column mean:

- **Request failed:** When requesting this file, the Seobility crawler was unable to reach the server. You can get more information about the cause from the HTTP status code next to it (if available). You can find an overview of the meaning of different HTTP status codes [here](#).
- **Timeout:** The server was reached when the file was requested. However, it did not send a response within 10 seconds. Common cause: server performance issues.
- **SSL/TLS error:** A problem has occurred during the [SSL/TLS handshake](#).
- **Invalid URL scheme:** The URL of the embedded file is incorrect.
- **Bot error (unknown):** An unknown problem occurred while retrieving the file.

How to fix the most common problems:

A common cause of unretrievable files is **poor server performance**. This can lead to error messages such as "Request failed" or "Timeout". These errors often occur in combination with long page response times (see the "distribution of response times" analysis in the Tech. & Meta section). You can find [tips for improving your server response times here](#).

Another common cause is that the **Seobility Bot is blocked from accessing the files**. This can lead to error messages such as "Request failed" or an HTTP status 403. In these cases, you need to make sure that the Seobility Bot is allowed to access your website. You can find an overview of [Seobility's user agent and IP addresses here](#).

In the case of 404 errors and invalid URLs: correct or remove internal links that point to the wrong file URL (which cannot be retrieved). You can find these links by clicking on the URL in the list. This will allow you to see all the pages that contain the file in question.

#	URL	Content type	Statuscode	Error
1.	https://www.healingtherapycenter.com/assets/img/blog-8.jpg	-/-	-/-	Timeout

Issues with file sources

Used files that have problems

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with embedded files on your website.

Why you should avoid problems with files on your website:

Files that are needed to **render** a page should be optimized in the same way as the HTML page itself.

Problems with files can result in the page not rendering correctly. This can have a negative impact on the user experience. It can also negatively affect **page speed**, which is an important Google ranking factor.

Overview of what the error messages ("Problem" column) mean and how to fix them:

- **Missing content-type specification:** Your server is not providing **content-type** information when transferring the file, which can lead to rendering problems in the browser. Make sure that there is a content-type specified in the **HTTP header** for each file.
- **Different file extension:** The file extension does not match the content-type that is specified. Make sure that the two specifications are in line in order to avoid any display problems. For example, a CSS file with content-type "text/css" should end with ".css".
- **Missing compression:** Files are not sent compressed from the server, which can make loading slow. Use compression, like **gzip** for text files.
- **High load time:** The file takes longer than 1 second to load. Check out [our blog to find out](#) how to improve your loading speed.
- **Redirect:** The source URL of the linked file redirects to a different URL. Avoid unnecessary redirects by linking all files directly to the target file.
- **Large file size:** The file size is very large. Make sure that your images are no larger than 2 MB and that your CSS and JavaScript files are no larger than 0.5 MB.

Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "[page speed](#)") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

No errors or problems were found.

Internal link anchor texts that need improvement

Link anchors that can be improved

Optimization Tips

Video tutorial included ►

Here you will find pages that are internally linked with [link texts](#) that need improvement.

Why link text is important for SEO:

A link's anchor text is a very important element from an SEO perspective, as it tells search engines what the linked page is about. Ideally, it should contain the [keyword](#) for which the linked page (target page) is intended to rank. Link texts offer great potential for optimization, especially for internal links. This is because the frequent use of [exact-match" keyword link texts](#) is usually not penalized (unlike the use of such link texts for [backlinks](#)).

What the notes in the "Problems" column mean:

- **Link text to page is empty:** There are internal links pointing to the page with an empty link text.
- **Link anchor text is trivial:** The link text that is used to link to the page says nothing about the content of the page. (Typical examples are link text such as "here", "read more" or "read the article").
- **Link anchor text too long:** The text linking to the page is over 120 characters and should be shortened.
- **The link contains an image but has no alt-attribute:** The link to the page is not a regular text link, but is an image link. For such image links, search engines use the [ALT attribute](#) instead of the link text to learn about the linked page. However, when this error occurs, the image has no ALT attribute.

By clicking "Details", you can find out which page contains the link text that needs improvement.

How to optimize your link texts:

- The link text should provide a short, but still meaningful, description of the content of the page being linked to.
- Ideally, the link text should contain the keyword for which you want the linked page to be ranked.
- You should always provide a link text for a text link and an ALT attribute for an image link.

You can find more detailed instructions on how to optimize your internal links, including the link text, in our [internal linking guide](#).

No errors or problems were found.

Redirects

Internal redirects that have been linked

Optimization Tips

Video tutorial included ►

This list includes internally linked URLs that redirect to another URL on your website via a server-side [redirect](#) (status code 301).

Why you should avoid having internal links to redirecting URLs:

301 redirects are a good option if you need to change the URL of a page, or if you want to redirect multiple URLs to a single URL. However, for internal links, it is best not to link to a URL that redirects to another URL. Instead you should link directly to the destination of the redirect. This will avoid any errors if you decide to remove the redirect at some point.

Search engines like Google do follow your redirects (even if you have multiple redirects in a row), but if you use a lot of redirects, you are unnecessarily wasting the [crawling resources of the search engine bots](#). This keeps the bots busy following your redirects rather than crawling your actual page content. It can also increase [page load time](#) as each redirect requires a new request to be sent to the website server.

You can find more information about redirects [in our wiki](#) and [on the Google Search Central page](#).

What the information in this list means:

The left column ("Start URL of the redirect") shows the redirecting URL and (below it) the destination URL. The "Pages that link to a redirect" column lists all the pages that have a link pointing to the redirecting URL. If the link is located in a [canonical tag](#), [alternate link](#) or similar, you will see a note saying "Linked via canonical link, alternate link or similar".

How to fix internal redirects:

Change the links on the linking pages to point directly to the redirect's destination URL.

By clicking on the redirecting URL, you can see more details about where these links are located.

Pages with a big distance to the homepage

Pages that can only be reached with more than 3 clicks from the homepage

No errors or problems were found.

Canonical link errors

Canonical links that refer to broken links

No errors or problems were found.

Alternate link errors

Problems with alternate links (links to specify alternative language or country versions of a page)

No errors or problems were found.

Pages with only a few paragraphs

Pages with little text or few paragraphs

Optimization Tips

The pages in this list contain less than three paragraphs of text.

Why you should break up your content into clear paragraphs:

To make text easier to read and understand, it is very helpful to break it up into paragraphs. This makes it easier for visitors to understand your content. It also increases the likelihood that they will spend more time on your pages.

What does Seobility define as a "text block"?

A "text block" is a coherent text section that contains at least 100 characters and is enclosed by HTML structural elements such as <p> or <div>. Headings or lists are not counted as text blocks.

How to solve these problems:

In addition to the number of paragraphs that were found, the "Number of words" column will show you how long the content of the page is in total. If the word count is high, you should structure the text in a better way. Use headings, teasers, paragraphs and subheadings to break up the text.

On the other hand, if there is little text content on the page, there may be room to expand the content.

Note: For pages with image galleries, result lists, and similar content that does not require long/structured text, you can ignore the warnings.

More information on this:

- [Content is king - Seobility Wiki](#)

#	URL	Number of paragraphs	Number of words
1.	https://www.healingtherapycenter.com/suicide-hotline	2	207

Pages with little text

Pages that contain only very little text

Optimization Tips

The pages in this list contain less than 500 words.

Why pages with little text can be problematic:

A text that is too short is problematic if the subject or the keyword of the page requires detailed and extensive information. If your competitors are offering better and more comprehensive content on the same topic, you're going to struggle to rank with short content.

However, it is not necessarily a problem to have pages with little text. If the pages are e.g. image galleries, landing pages, etc., it is perfectly fine to use very little text.

In addition, there are times when search engine users are in need of a quick and concise answer to a particular search query, and a long and lengthy text page is not the answer. In this case, long and detailed text may deter visitors.

How you should treat these pages:

Before you make any changes to the content of a page, you should first check whether the topic or target keyword of the page requires extensive content or not. You can do this by analyzing the current top 10 search results. With the [free TF*IDF tool provided by Seobility](#), you can easily check the number of words on these pages.

If you find that the content of your page is in fact too short, you can try to expand it. Think about what kind of information your target audience needs in order to fulfil their [search intent](#). However, you'll want to avoid writing long texts that are just designed to boost SEO. Most importantly, your content should add value to your visitors.

Pages with duplicate paragraphs

Paragraphs that are repeated on a page

Optimization Tips

Video tutorial included ►

This analysis checks for pages where paragraphs of text are used repeatedly.

Why you should avoid duplicate text paragraphs on a page:

High-quality, interesting content that provides real value to visitors is one of the most important factors for a good ranking on Google. It is not a sign of quality content and good page design if the same paragraph is repeated several times on a page. Therefore, it is a good idea to remove duplicate paragraphs from your pages.

How to identify the duplicate paragraphs:

If you click on the red label in the "Number" column, you will get an overview of all the paragraphs that have been found on the page in question. For each paragraph, you can see how many times it is used on the page and how many times on the whole website.

Special case: cookie banners

Cookie banners displayed on all subpages of a website are not problematic from an SEO perspective and are therefore automatically recognized by Seobility and ignored in the analysis. However, to be safe, you can add the `"data-nosnippet"` attribute to your cookie banner. This will ensure that Seobility does not analyze this part of the HTML code. Google also recommends using this attribute if you want certain parts of a page's HTML code to be ignored and not displayed in the search result snippet.

#	URL	Number
1.	https://www.healingtherapycenter.com/all-blogs	2 duplicate paragraphs

Pages using keywords in page title but not in its body text

Pages with keywords in the title tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the page title do not appear in the actual content of the page.

Why titles and content should be consistent:

The [page title](#) is one of the most important on-page SEO elements and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in the title, with the most important keyword at the very beginning. To ensure consistency between title and content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's page title. The words in the title that do not appear in the content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the page title matches the actual content of the page, and vice versa.

If the title contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the title is not, then you should optimize the title and include important keywords for the page there.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

#	URL	Words from the page title that don't appear in the text

Pages using keywords in H1 heading but not in its body text

Pages with keywords in the H1 tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the H1 heading do not appear in the text content of the page.

Why H1 headings and content should be consistent:

The [H1 heading](#) is an important on-page SEO element and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in this heading. To ensure consistency between the H1 heading and the content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's H1 heading. The words in the heading that do not appear in the text content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the H1 heading matches the text content of the page, and vice versa.

If the H1 contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the H1 is not, then you should optimize the H1 and include important keywords for the page there.

Ensure that the H1 heading differs from the [page title](#). Both elements should be unique.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

#	URL	H1 heading

Pages with very much text

Pages that contain a lot of text and might be divided into several pages

No errors or problems were found.

Pages with typos

Page content contains typos

No errors or problems were found.

Pages with filler text and images

Pages with filler texts or images

No errors or problems were found.

Content that appears on several pages

Content/text that is used on more than one page

Optimization Tips

Here you will find an overview of text blocks that are used on several pages of your website.

For this analysis, each text block found on your website is normalized and saved. If the same text block appears on several pages, it is detected and displayed here.

Notes, disclaimers, etc. that appear on a large number of your pages will not be taken into account.

Why you should avoid using duplicate text blocks:

Each page should be unique and tailored to its target [keyword](#). This will ensure that the content is as relevant as possible. That's why you should avoid using duplicate text blocks or generic content.

If very long text blocks are used multiple times on your website, you may also run into problems with [duplicate content](#). For example, if you use long snippets of blog posts on the category pages or the home page of your blog, this could have a negative effect on the rankings of the actual blog posts. This is because Google has to decide which of these pages should appear in the search results if both a category page and a blog post contain relevant content for a keyword. As a consequence, it may choose the wrong one.

How to fix these problems:

As a general rule, you should avoid using generic text that is used on multiple pages. Create unique content for each subpage instead.

To avoid duplicate content problems, keep the preview text of blog articles or similar as short as possible.
